

Resultant Item Setup

A resultant item is an item that is manufactured by the company. It is made up of various components that are linked to a Bill of Material. When the Bill of Material (BOM) is manufactured, the resultant or manufactured item is then added into the stock.

The system thus needs to be able to differentiate a BOM or resultant item from a standard item.

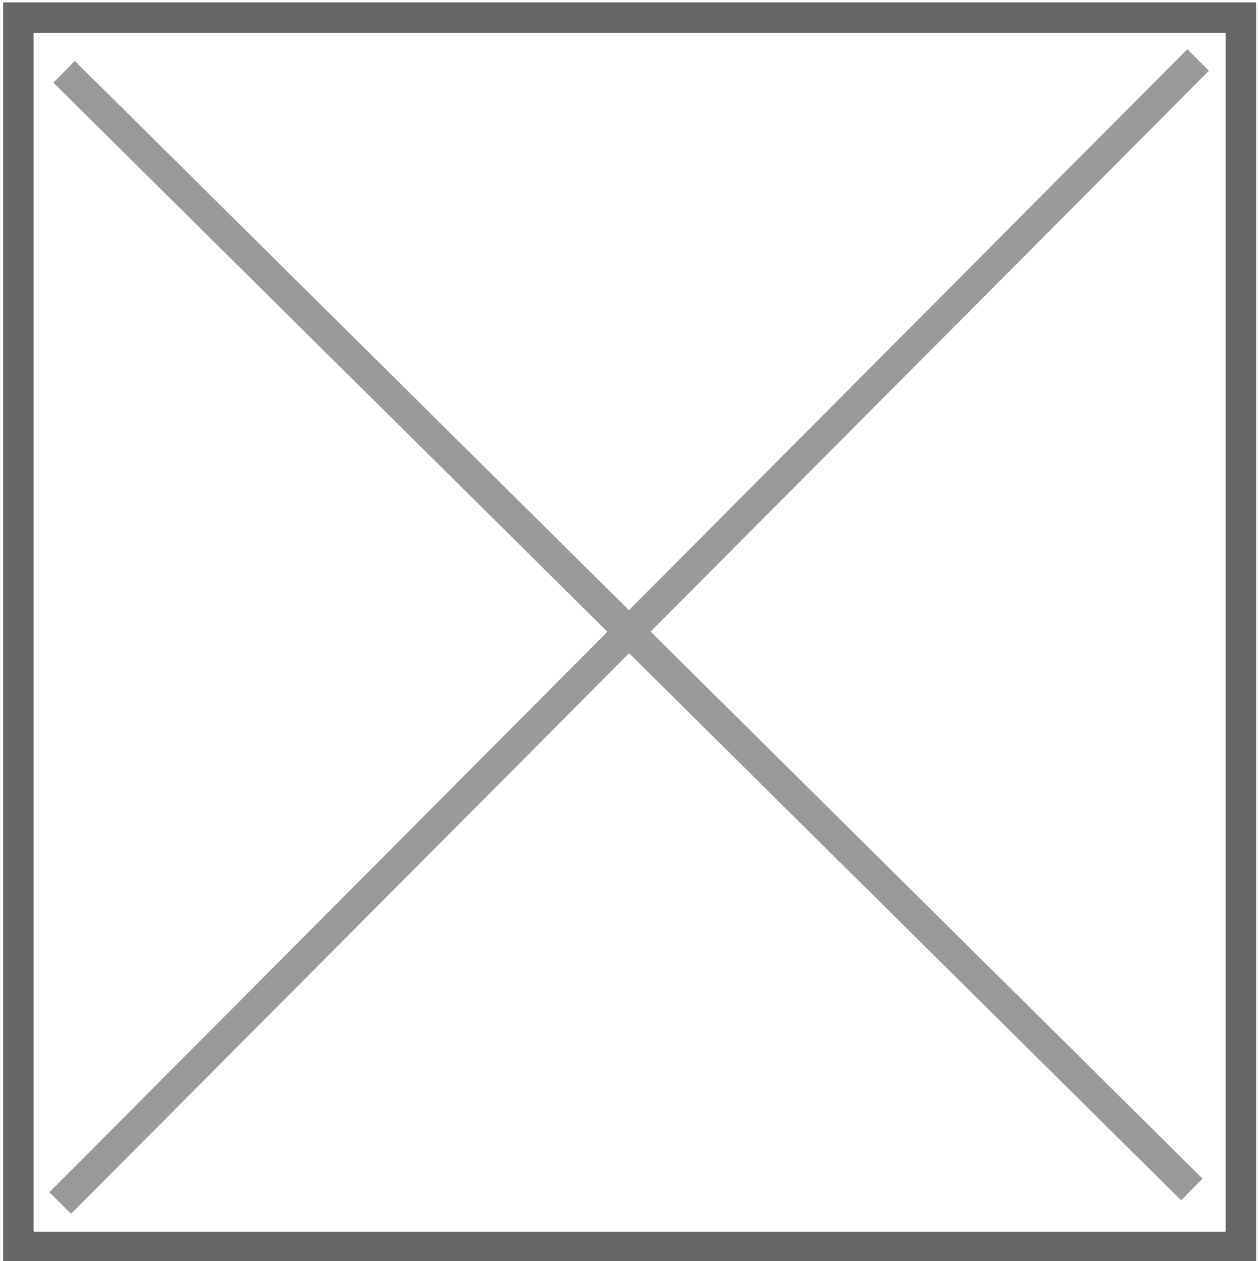

To mark an item as a resultant item, create a stock. refer to Inventory Item setup section.

Click the Bill of Material tab

Tick the activate BOM Box

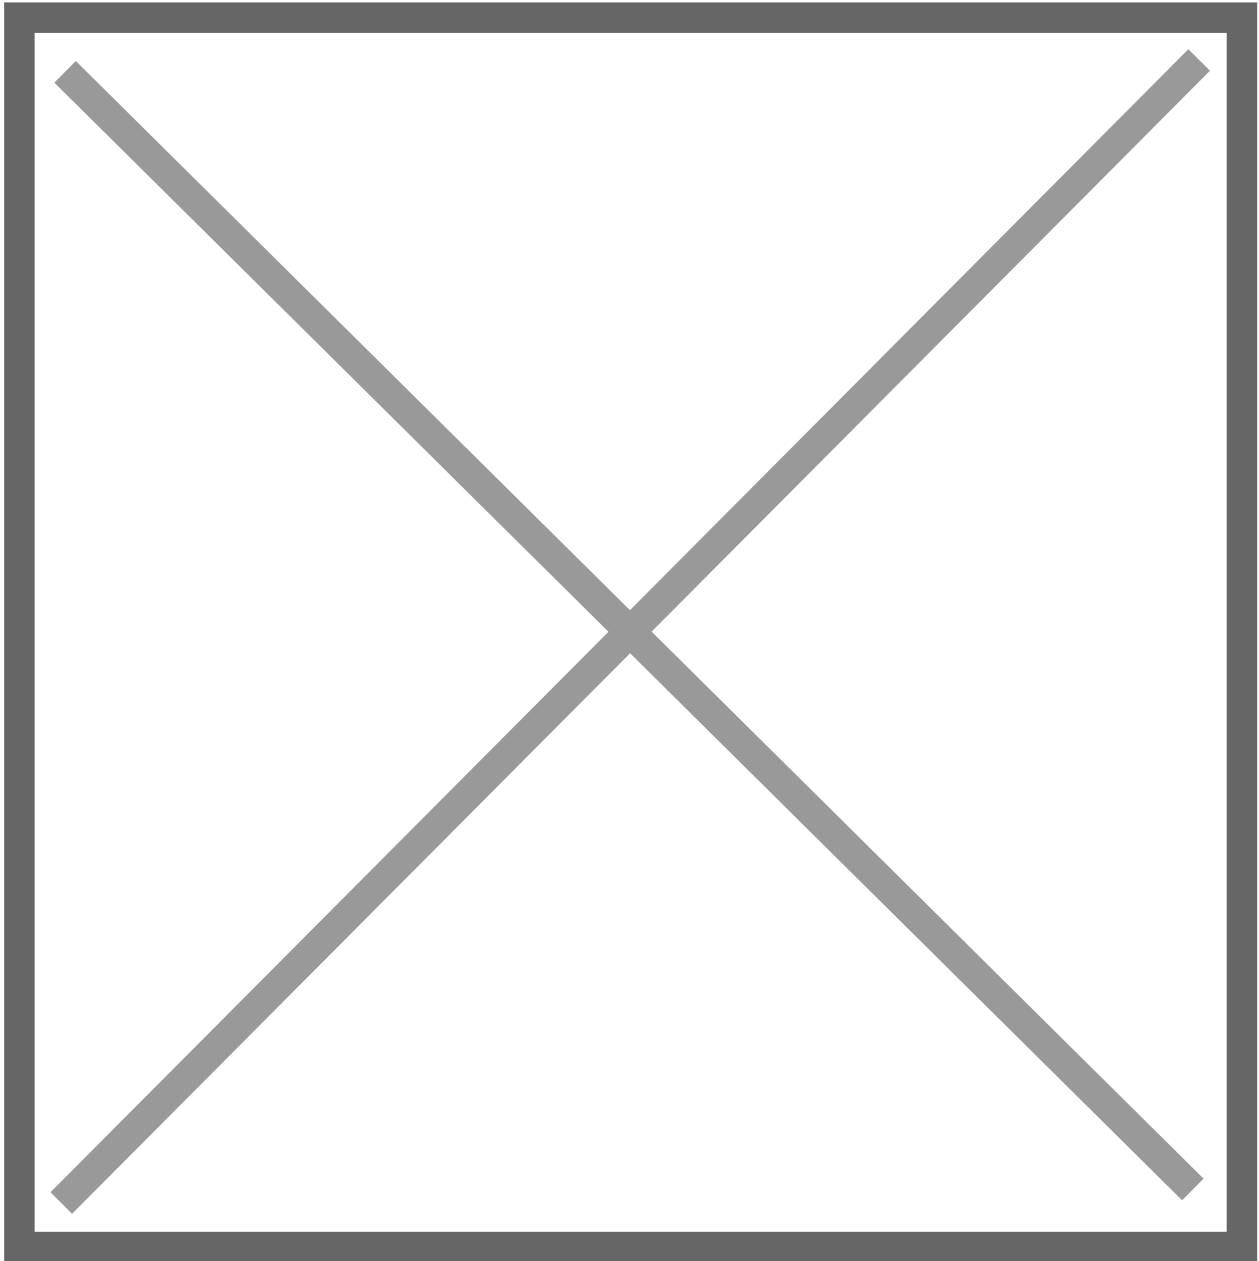

One can opt to show the underlying components of this resultant item on various documents.

Ticking any of the boxes will result in the components being displayed on the respective document.

Tick the BOM Item Box

Click Save and Close
