Security Role Permissions

System Configuration> Security> Role Permissions

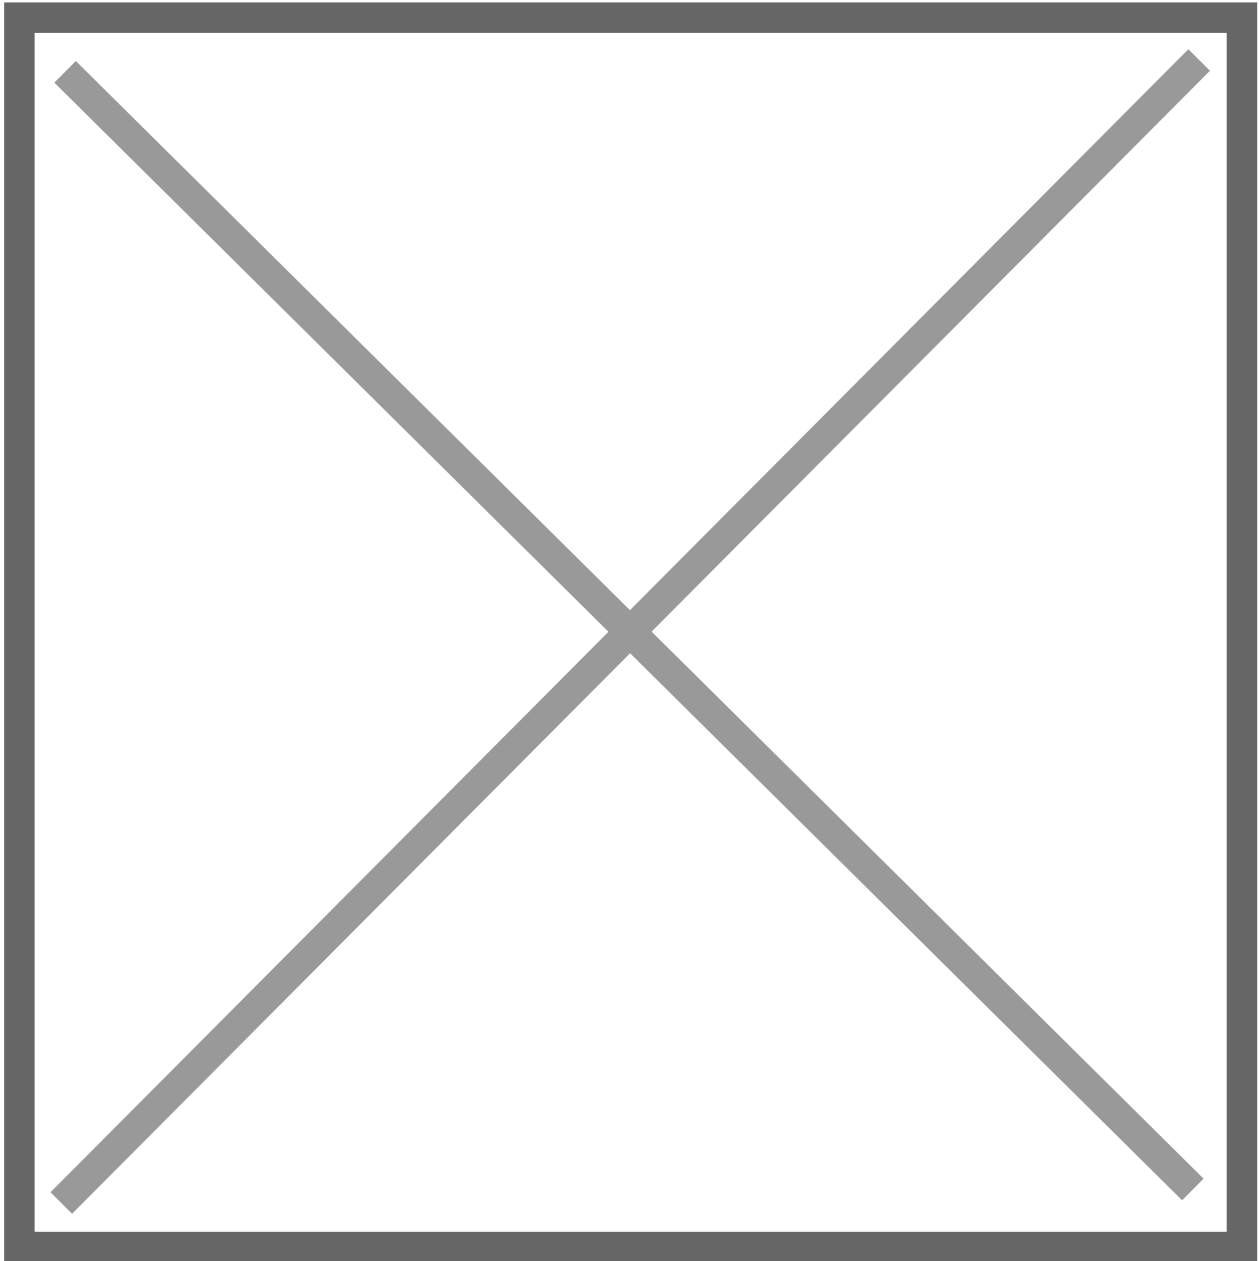

To create a new role permission, first select the Module that you want the role permission to fall under. Click on the Insert button

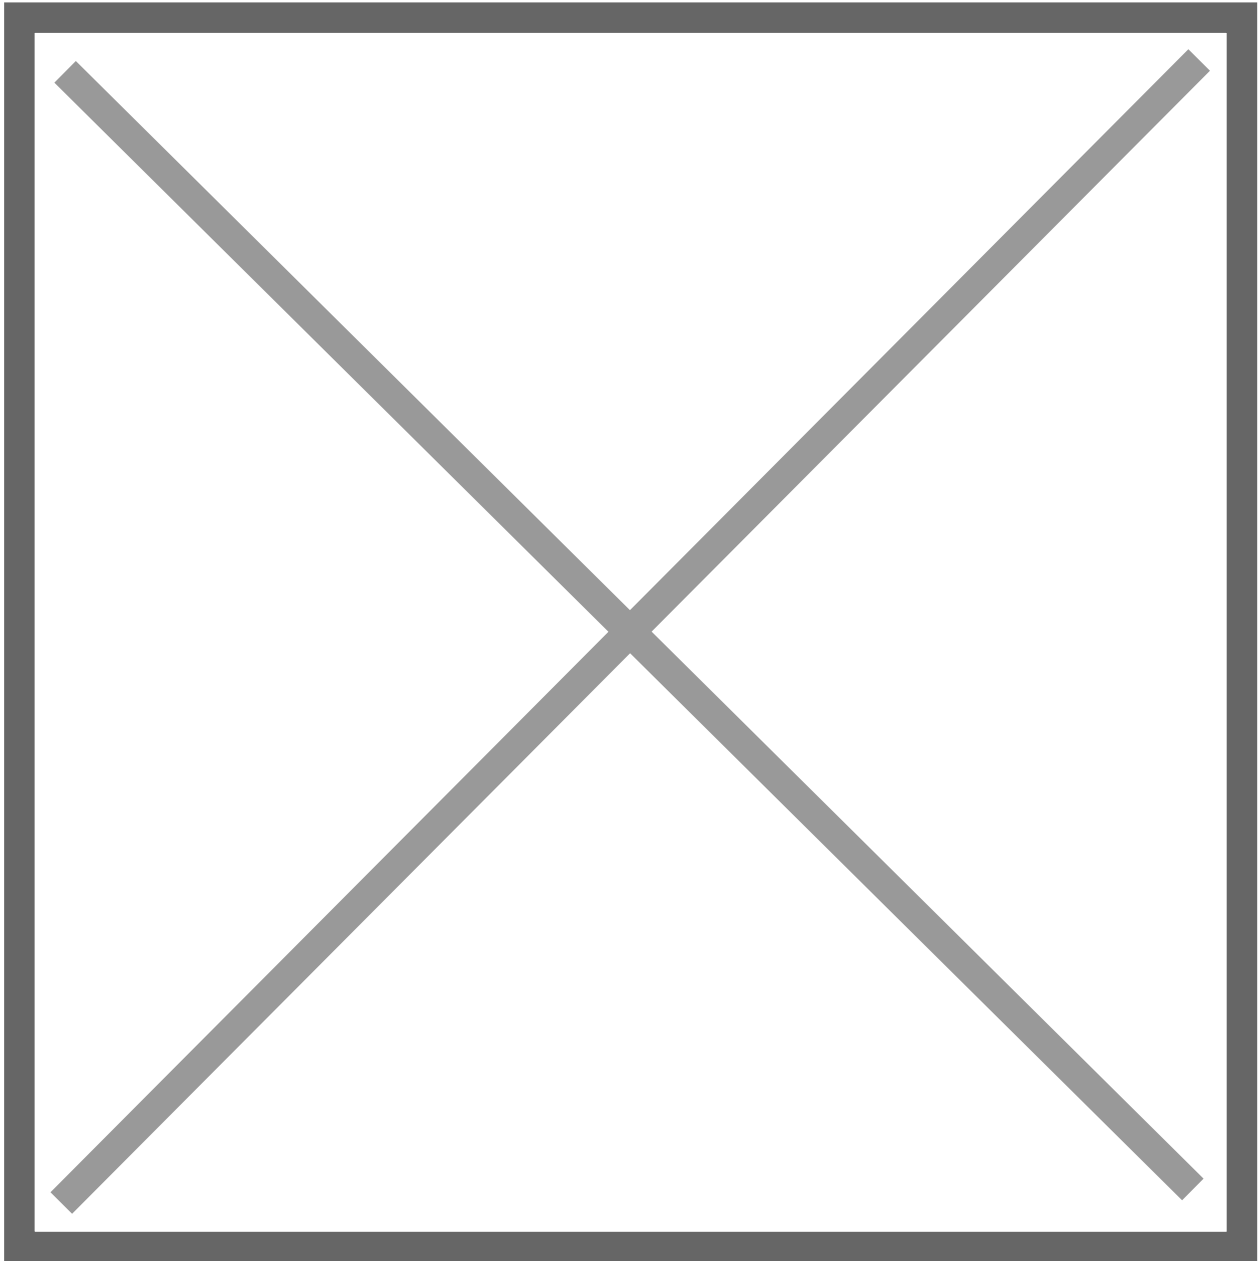

Enter a name that you can identify the role permission.

After clicking OK, Select the new Role created. We have to first setup the menu groups under that module and then the menu Items to be viewed by that role. Select the Menu Group which you want the user to see.

Go to the Menu Item selection and select the drop down for Menu Group. Now give access to the menu you want the role to see.

When the user logs in he will only see that menu item under the inventory module.

Role Permissions

Video training manual 2016 - [Click Here](#)

System Configuration> Security> Role Permissions Role Permissions is a setup that allows the administrator to control the user permission to menu items

On Our Webatar Module

We have created a Security Role called Tester.

We will be giving access on the activity menu group by moving the menu we want to the right box (selected)
